

What does this get us?

```
when(busy, idle) { 
    val r = busy.use();
    idle.use(r)
when(log) {  }
    idle.use(r)
}

when(busy) { 
    when(log) {  }
}
```

when(src) { 

when(dst) {  }

}

when(dst) {  }

when(dst) {  }

when(src) {  }

when(dst) {  }

}

Can we release cows early?

Can we render behavior individual?

After the last behavior span

We can reason about program transformations

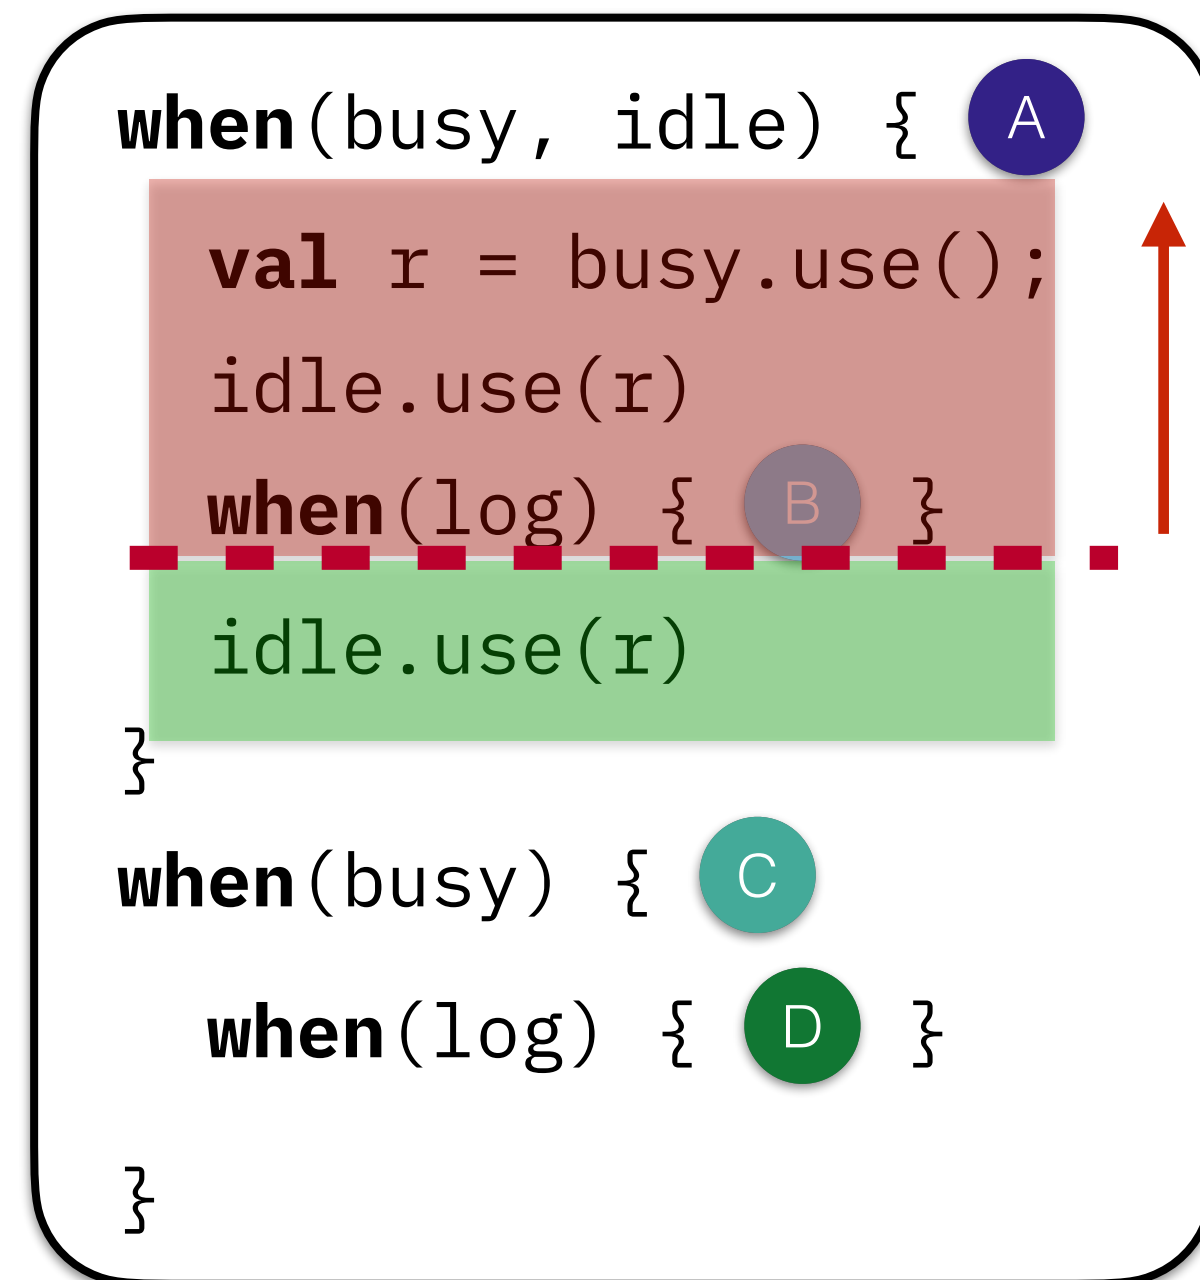

As long as we aren't violating causality

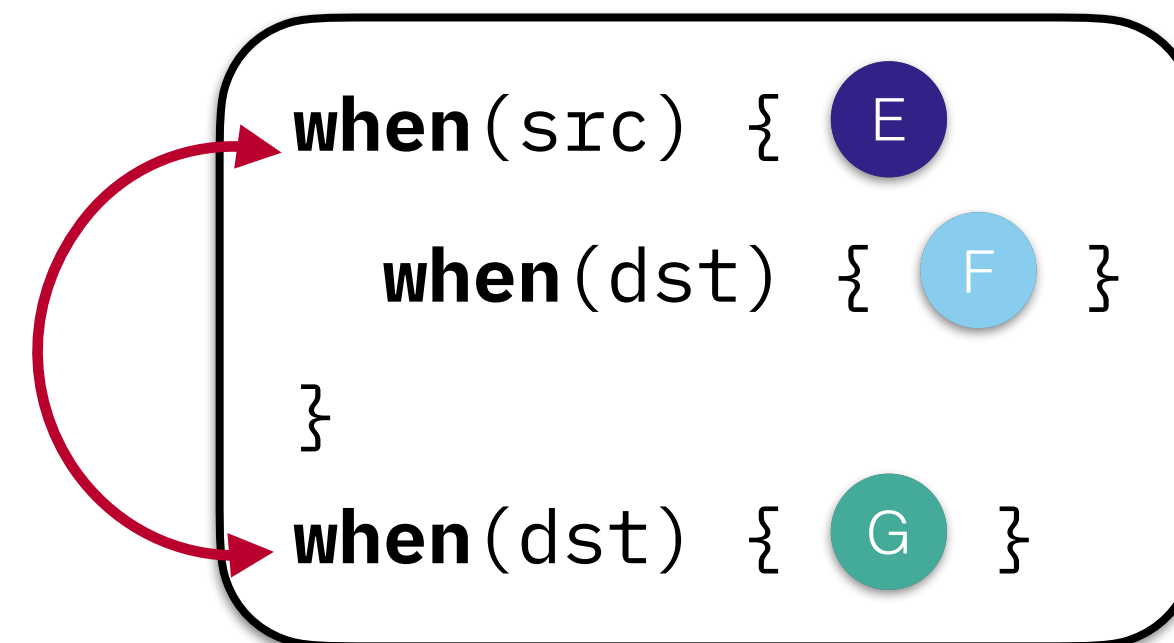

What does this get us?

We can reason about program transformations

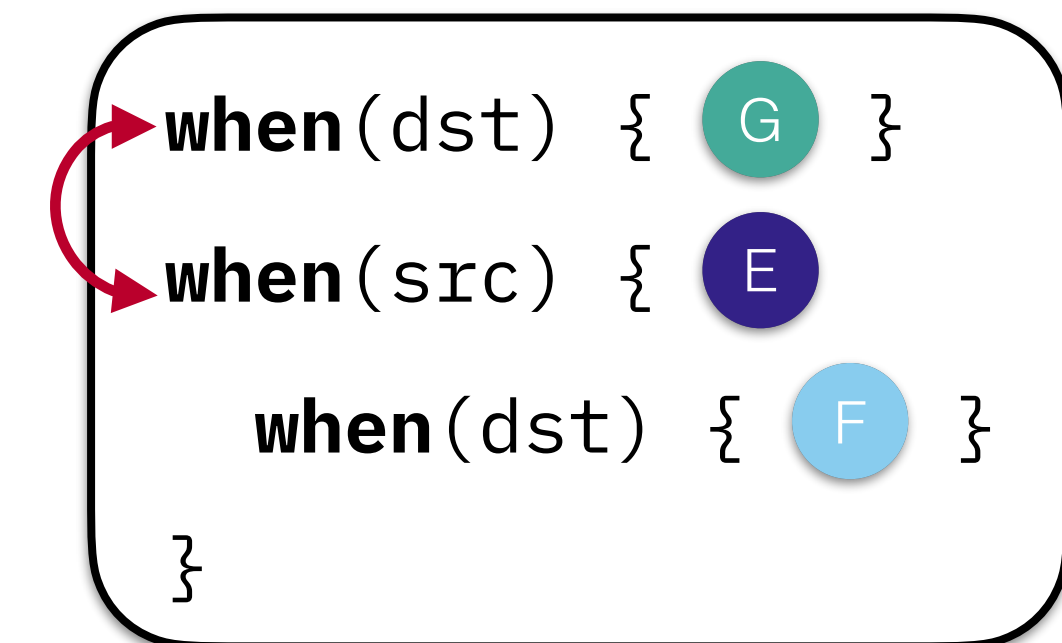

Can we release cows early?

After the last behaviour spawn

Can we reorder behaviours?

As long as we aren't violating causality

Future and Conclusion
