

```
when(dst) {  dst.balance += 10; }
```

**when(src) {  src.balance += 10; }**

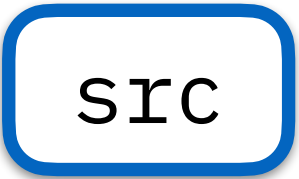

What should this program be able to do?

3

6

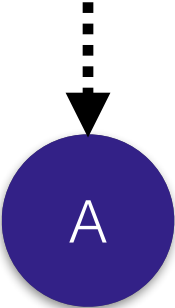

```
when(dst) {  print(dst.balance) }
```

How can this program execute?

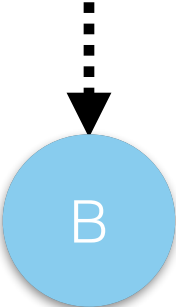

src

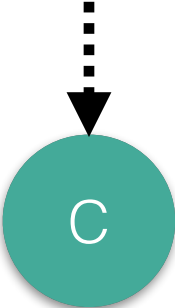

dst

```
when(src) {  print(src.balance) }
```

Is it possible for  then  ?

./proram

src=10,

dst = 10

```
> ./program
```

```
> src=10, dst=10
```

`dst.balances += 10;`

**when(odst)**

B

`src.balance += 10;`

**when (src) {**

A

when(odds) ~

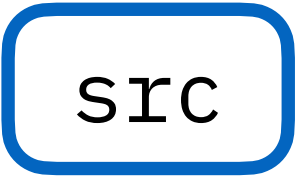

```
print(dst.balance)
```

A teal circle with a white letter C inside.

C

src

dst

**when(sinc)**

```
print(src.bailance)]
```

D

then

Is it possible for

D

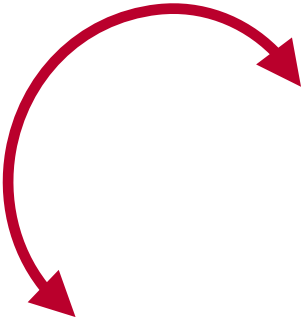

A

> src≡10, dst≡10

> src=0, dst=10

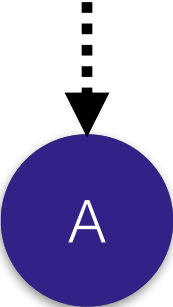

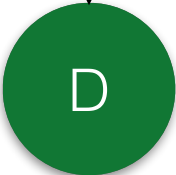

3

7

**when(src) {**

```
print(src.bailance)]
```

D
