

What does this get us?

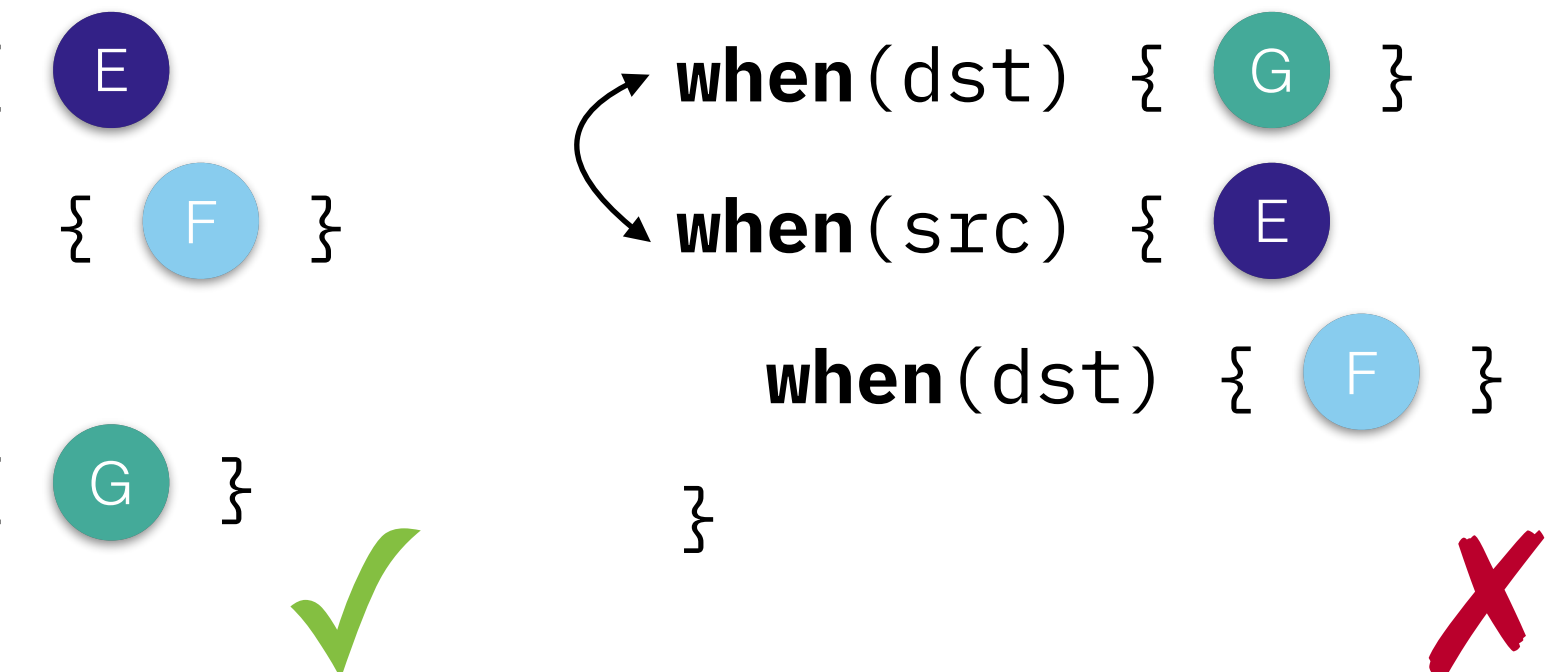

- What does it mean to say all of the executions the semantics provide are even correct?

What does this get us?

- The why this happens isn't so important (it lies in choices in the way the semantics are built)
- There are impacts on tooling and optimisation for BoC programs

Can we release cowns early?

Can we reorder behaviours?

- What does it mean to say all of the executions the semantics provide are even correct?
