

```
when(dst) {  dst.balance += 10; }
```

```
when(src) {  src.balance += 10; }
```

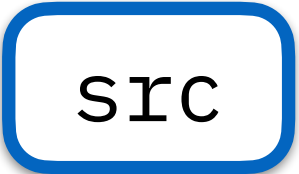

The sciences have identified restrictions on

3

2

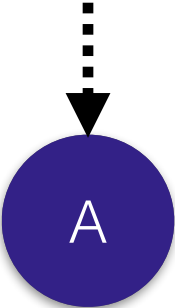

```
when(dst) {  print(dst.balance) }
```

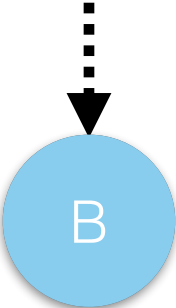

When executed concurrently, the update path and the diagnostic path are seemingly independent.

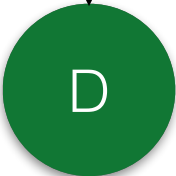

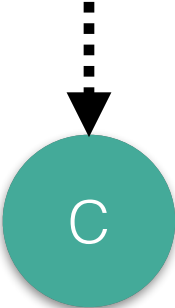

src

dst

```
when(src) {  print(src.balance) }
```

updatepath(src then dst)

Diagnostic path (dst then src)

But, the semantics and all its implementation prohibit okay behaviour orders. 

`dst.balances += 10;`

when(odst) }

B

`src.balance += 10;`

when (src) {

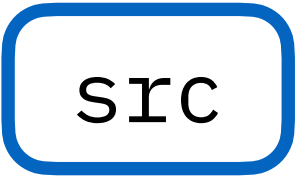

A

when(odst) is

```
print(dst.balance)
```

A large teal circle with a white capital letter 'C' in the center.

C

src

dst

```
print(src.bailance)]
```

when(sirc) ~

D
