

```
when(dst) {  dst.balance += 10; }
```

**when(src) {  src.balance += 10; }**

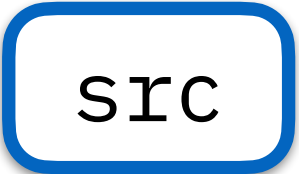

The design for behavior driving was missing

3

4

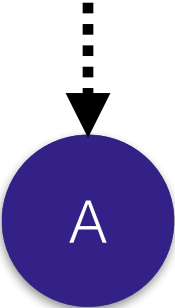

```
when(dst) {  print(dst.balance) }
```

When executed concurrently, the update path and the diagnostic path are seemingly independent.

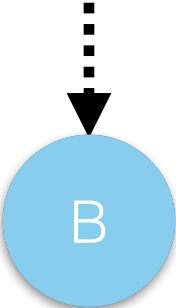

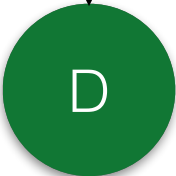

src

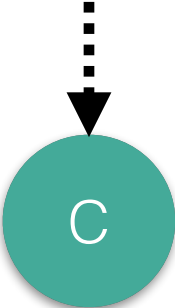

dst

```
when(src) {  print(src.balance) }
```

updatepath(src then dst)

Diagnostic path (dst then src)

What about swapping  and ?

`dst.balances += 10;`

**when(odst)**

B

`src.balance += 10;`

**when (src) {**

A

when(odds) %>%

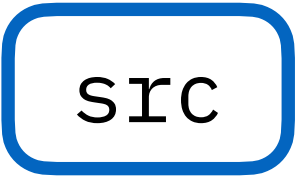

```
print(dst.balance)
```

A large teal circle with a white capital letter 'C' in the center.

C

src

dst

**when(sirc) ~**

```
print(src.bailance)]
```

D

and

What about swapping

A

D
