

Why did we design Behavior-oriented Concurrency (BoC)?

Inspired by the Actor model

balance: 100

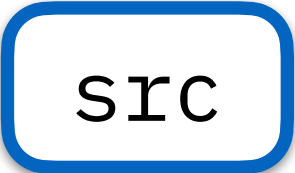

frozen: false

balance: 50

frozen: false

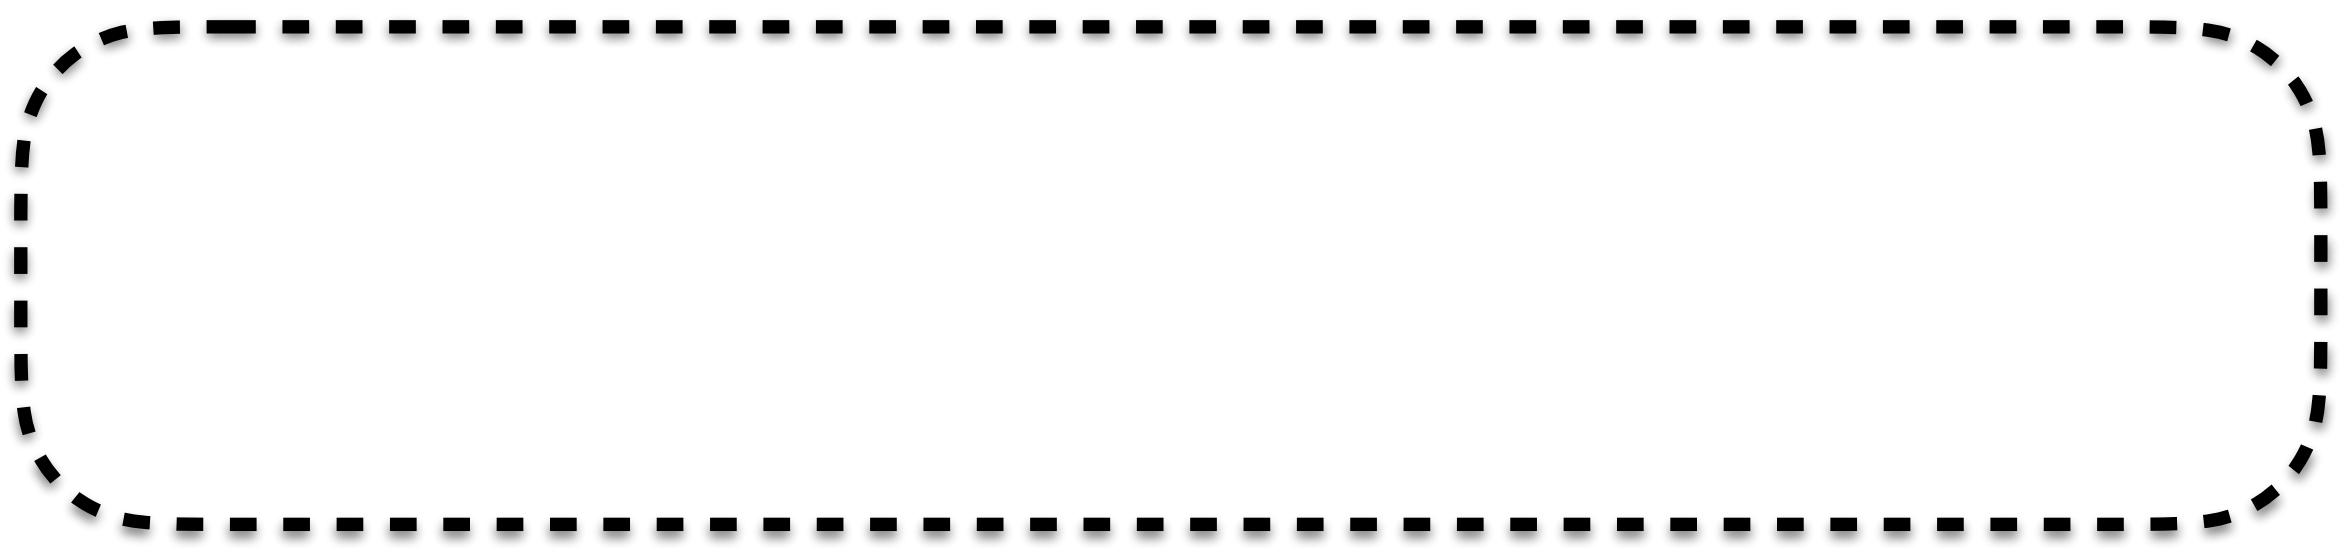

src

dst

deposit(10)

freeze()

transfer(src, dst, 50)

But, coupling isolation and currency makes multi-act a hard

Highly concurrent and data-race free

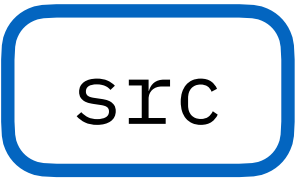

balance: 100

frozen: false

balance: 50

frozen: false

src

dst

deposit(10)

freezer

transfer(src,dst,50)

BoC de couples isolation and currency
